U.S. Serial No.: 08/475,784
Filed : June 7, 1995
Page 7

Remarks:

Claims 18-20, 53, 55-57, and 59-77 were pending in the subject application. Applicants have hereinabove canceled claims 18-20, 53, 55-57, and 59-77 without prejudice to their right to pursue the subject matter of these claims in a later-filed application and added new claims 78-100. Support for these claims may be found inter alia in the specification as follows:

claim 78: page 11, lines 13-15; page 12, lines 23-26, page 32, lines 1-20, and page 76, lines 19-21; claims 79-81: page 12, lines 28-31; claim 82: page 12, lines 1-2; claim 83: page 12, lines 15-16; claims 84-88: page 13, lines 8-26; claims 89-91: page 14, lines 1-5; claim 92: page 43, lines 4-9 and page 53, line 35 to page 54, line 1; claim 93: see support for claim 78 and page 15, lines 11-22; claim 94: see support for claim 78 and page 73, lines 15-18; claim 95: see support for claim 78 and page 15, line 26 to page 16, line 20; claims 96-98: page 17, lines 5-10; and claims 99-100: page 18, lines 5-10. Accordingly, claims 78-100 do not involve any issue of new matter such that entry of this amendment is respectfully requested.

Claims 18-20

The Examiner stated that upon his review of the file history it is noted that the response of March 9, 1998 requested the cancellation of claims 1-4, 8-16 and 44-52. The Examiner stated that however, the text of the response indicates that claims 18-20 were canceled. The Examiner stated that it appears from subsequent communications, that both applicants and the previous examiner considered these claims canceled. The Examiner stated that however, these claims remain pending until such time that a specific request for cancellation is received.

In response, applicants have hereinabove canceled claims 18-20 without prejudice to their right to pursue the subject matter of

Applicants : Philip O. Livingston and Friedhelm Helling
U.S. Serial No.: 08/475,784
Filed : June 7, 1995
Page 8

these claims in a later-filed application. Applicants contend that this amendment obviates this ground of objection.

Figure 6B

The Examiner maintained the prior objection to the disclosure for the reasons as set forth in the last Office Action mailed 6/10/96. The Examiner stated that applicants submit they will provide a new Figure 6B to overcome the rejection when the case is in condition for allowance. The Examiner stated that until applicants submit a proper Figure said objection is maintained.

In response, applicants without conceding the correctness of the Examiner's will consider submitting a new Figure 6B upon the indication of allowable subject matter.

Obviousness type double patenting rejection

The Examiner provisionally rejected claims 53, 55-57, 59-77 under the judicially created doctrine of obviousness-type double patenting as being unpatentable over the claims 53-77 of copending Application No. 08/477,097.

The Examiner stated that applicants assert that the added new claims in the copending application obviate the obvious type double patenting. The Examiner stated that applicant's arguments are not persuasive since the claims of the instant application encompass conjugating the ceramide portion of GM2 via a variety of linkages as recited the claims in copending application 08/477,097. The Examiner stated that applicants amendments are insufficient to remove the rejection. The Examiner stated that even if applicants limited the '097 application to GD2, it is noted that the conjugation of GD2 would be obvious over the others because they all have similar base structure and are

Applicants : Philip O. Livingston and Friedhelm Helling
U.S. Serial No.: 08/475,784
Filed : June 7, 1995
Page 9

derived from GM3 as indicated by Ritter et al (Cancer Biology, 1991) of record.

The Examiner stated that claims 53,55-57, and 59-77 are provisionally rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 44 and 46-56 of copending Application Nos. 08/477,147 and 08/481,809.

The Examiner stated that although the conflicting claims are not identical, they are not patentably distinct from each other for the reasons set forth in the prior Office Actions. The Examiner stated that applicant's amendments are insufficient to overcome the double patenting rejection in regard to 08/481,089 or 08/477,147.

The Examiner stated that claims 53,55-57, 59-77 are provisionally rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 69-96 of copending Application Nos. 08/196,154. The Examiner stated that the instantly claimed compositions drawn to specific species of gangliosides conjugated to KLH anticipate the broader claims of 08/196,154.

In response, applicants respectfully traverse the Examiner's above rejection. Nevertheless, applicants without conceding the correctness of the Examiner's position but to expedite prosecution of the subject application have hereinabove canceled claims 18-20, 53, 55-57, and 59-77 without prejudice or disclaimer to their right to pursue the subject matter of these claims in a later-filed application and added new claims 78-100. Applicants contend that this amendment obviates the above rejection and respectfully request that the Examiner reconsider and withdraw this ground of rejection.

Filed : June 7, 1995
Page 10

Rejection under 35 U.S.C. 112, first paragraph

The Examiner rejected claims 53-57, 59-72 and 73-77 under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention for the reasons set forth in the Office Action mailed 6/10/96 (see Paper No.9).

The Examiner stated that applicants argument's have been carefully considered. Applicants' again argue make and test. The Examiner stated that this is again not persuasive for reasons already extensively made of record in the previous response and reiterated below.

The Examiner stated that protein chemistry is probably one of the most unpredictable areas of biotechnology. The Examiner stated that for example, replacement of a single lysine residue at position 118 of the acidic fibroblast growth factor by glutamic acid led to a substantial loss of heparin binding, receptor binding, and biological activity of the protein (see Burgess et al.) i The Examiner stated that n transforming growth factor alpha, replacement of aspartic acid at position 47 with alanine, or asparagine did not affect biological activity while replacement with serine or glutamic acid sharply reduce the biological activity of the mitogen (see Lazar et al.). The Examiner stated that Rudinger et al. Teaches "particular amino acids and sequences for different aspects of biological activity can not be predicted a priori but must be determined from case to case by painstakingly experimental study" (see page 6). The Examiner stated that Salgaller et al teach modifications (i.e. deletions) of the amino acid structure of peptide can alter the activity of the protein. Fox et al. The Examiner stated that teach methods for determining fragments which have antigenic activity is unpredictable. The Examiner stated that these

Applicants : Philip O. Livingston and Friedhelm Helling
U.S. Serial No.: 08/475,784
Filed : June 7, 1995
Page 11

references demonstrate that a even single amino acid substitution or what appears to be an inconsequential chemical modification, will often dramatically affect the biological activity of a protein. The Examiner stated that in view of the lack of guidance, lack of examples, and lack of predictability associated with regard to producing and using the myriad or derivatives and fragments encompassed in the scope of the claims one skilled in the art would be forced into undue experimentation in order to practice broadly the claimed invention.

The Examiner stated that contrary to applicants arguments it is reasonable to conclude an undue burden is required to screen for positions within the sequence where amino acid modifications (i.e. additions, deletions, or modifications) can be made with a reasonable expectation of success in obtaining similar activity/utility are limited and the result of such modifications is unpredictable as exemplified by the teachings of Lazar et al., Burgess et al., Rudinger et al., and Salgaller et al. The Examiner stated that these references demonstrate that a even a single amino acid substitution or what appears to be an inconsequential chemical modification, will often dramatically affect the biological activity of a protein.

The Examiner stated that the specification does not support the broad scope of the claims which encompass a multitude of analogs or equivalents because the specification does not disclose the following: the general tolerance to modification and extent of such tolerance; specific positions which can be predictably modified; and the specification provide essentially no guidance as to which of the essentially infinite possible choices is likely to be successful.

The Examiner stated that thus, applicants have not provided sufficient guidance to enable one skilled in the art to make and use the claimed derivatives in a manner reasonably correlated

Applicants : Philip O. Livingston and Friedhelm Helling
U.S. Serial No.: 08/475,784
Filed : June 7, 1995
Page 12

with the scope of the claims broadly including any number of deletions, additions, and/or substitutions of any size. The Examiner stated that the scope of the claims must bear a reasonable correlation with the scope of enablement (In re Fisher, 166 USPQ 19 24 (CCPA 1970)). Without such guidance, the changes which can be made and still maintain, activity/utility is unpredictable and the experimentation left to those skilled in the art is unnecessarily, and improperly, extensive and undue. The Examiner stated that see Ex parte Forman, 230 U.S.P.Q. 546 (Bd. Pat. App. & Int. 1986).

The Examiner stated that applicants cite to page 12, lines 4-13 of the specification for support of using derivatives of KLH. The Examiner stated that said disclosure is not commensurate in scope with the claimed invention. The Examiner stated that said cite makes reference only to linking KLH to an "immunological adjuvant" and not amino acid modifications (i.e. deletions, substitutions) of KLH. The Examiner stated that as set forth above the scope of the claims must bear a reasonable correlation with the scope of enablement (In re Fisher, 166 USPQ 19 24 (CCPA 1970)). The Examiner stated that for the reason set forth above and in the last Office Action said rejection is maintained.

In response, applicants respectfully traverse the Examiner's above rejection. Applicants contend that the claimed invention was enabled. Nevertheless, applicants without conceding the correctness of the Examiner's position but to expedite prosecution of the subject application have hereinabove canceled claims 18-20, 53, 55-57, and 59-77. Applicants contend that the invention of newly submitted claims 78-100 is enabled. Applicants contend that this amendment obviates the above rejection and respectfully request that the examiner reconsider and withdraw this ground of rejection.

Applicants : Philip O. Livingston and Friedhelm Helling
U.S. Serial No.: 08/475,784
Filed : June 7, 1995
Page 13

The Examiner stated that as to claims 67-72, the claims are enabled for the use of the composition only for the treatment of cancer but are not enabled for the prevention of cancer, for reasons made of record in Paper No. 9, mailed 6-10-96.

In response, applicants respectfully traverse the Examiner's above rejection. Applicants contend that a claim directed to the prevention and treatment of a cancer using the subject composition is fully enabled. In support of claims concerning the treatment and/or prevention of the cancer, applicants attach hereto as Exhibit A a copy of the following paper: Helen Zhang et al "Antibodies against GD2 Ganglioside Can Eradicate Syngeneic Cancer," Cancer Research 58: 2844-2849 (1998). This paper demonstrates that the conjugated vaccine of the subject invention prevents the outgrowth of micrometastases (see page 2844, first column). The paper shows that the conjugated vaccine prevents establishment of subsequently administered EL4 challenge (which is a lymphoma), and eliminates EL4 micrometastases when administered after EL4 challenge (see page 2844, second column). The paper shows that mice receiving the conjugate vaccine survived significantly longer, and that one mouse did not show any evidence of tumor (see page 2845, second column). The paper teaches that the conjugated vaccine protects against tumor challenge and eliminates micrometastases. Applicants contend that this is support for the use of the composition to treat or prevent cancer. Applicants contend that these remarks obviate the above rejections and respectfully request that the Examiner reconsider and withdraw the rejection.

Rejection under 35 U.S.C. 112, first paragraph

The Examiner rejected claims 53, 55-57 and 59-77 under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s),

Applicants : Philip O. Livingston and Friedhelm Helling
U.S. Serial No.: 08/475,784
Filed : June 7, 1995
Page 14

at the time the application was filed, had possession of the claimed invention. The Examiner stated that this is a new matter rejection.

The Examiner stated that applicants point to page 32, lines 13-18 and page 1. The Examiner stated that this is not persuasive, the passage at page 32, lines 13-18 provide for a *specific coupling procedure at the C-4 carbon of the sphingosine moiety of the ceramide to the e-aminolysyl group of a proteins* (ozonolysis, production of a functional aldehyde group and coupling to an e-aminolysyl group on a protein by reductive amination. The Examiner stated that the passage at page 12, lines 22-26 in combination with the passage at page 32, lines 13-18 does not support a broad coupling to any generic portion of the ceramide backbone of the ganglioside, by any generic means by cleavage of any double bond (i.e. C=O) and coupling by any linkage process. The Examiner stated that the written description at page 12 and 32 does not support by way of written description, convey that applicants had at the time of filing contemplated any means of coupling to any portion of the ceramide, a concept that is now broadly claimed. Applicants were clearly not in possession of that which is now broadly claimed. Correction is required.

In response, applicants respectfully traverse the Examiner's above rejection. Applicants contend that they were in possession of the claimed invention at the time of filing. Nevertheless, without conceding the correctness of the Examiner's position but to expedite prosecution of the subject application have hereinabove canceled claims 18-20, 53, 55-57, and 59-77 without prejudice or disclaimer to their right to pursue the subject matter of these claims in a later-filed application. Applicants have also hereinabove added new claims 78-100 which recite that "the ganglioside derivative is conjugated to Keyhole Limpet Hemocyanin or the derivative thereof through a C-4 carbon of the sphingosine base of the ceramide portion of the ganglioside

Applicants : Philip O. Livingston and Friedhelm Helling
U.S. Serial No.: 08/475,784
Filed : June 7, 1995
Page 15

derivative to the ϵ -aminolysyl group of Keyhole Limpet Hemocyanin or the derivative thereof." Applicants respectfully direct the Examiner's attention to page 32, lines 15-20 for support for this claim language. Applicants contend that this amendment obviates the above rejection and respectfully request that the Examiner reconsider and withdraw this ground of rejection.

Rejection under 35 U.S.C. 112, second paragraph

The Examiner rejected claims 55-57 under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. The Examiner stated that claims 55-57 are rendered indefinite because they depend from canceled claim 54. The Examiner stated that correction is required.

In response, applicants without conceding the correctness of the Examiner's position but to expedite prosecution of the subject application have hereinabove canceled claims 18-20, 53, 55-57, and 59-77 without prejudice to their right to pursue the subject matter of these claims in a later filed application. Applicants contend that this amendment obviates the above rejection and respectfully request that the Examiner reconsider and withdraw this ground of rejection.

Rejection under 35 U.S.C. 103(a)

The Examiner rejected claims 18-20, 53, 55-67 and 69-72 under 35 U.S.C. 103(a) as being unpatentable over Livingston et al. (Cancer Research), Ritter et al., Livingston et al. (U.S. Patent No. 5,102,663) and Ritter et al. (Immunobiol, 182:32-43, 1990) and further in view of Kensil et al and Marciani et al. for the reasons set forth in the Office Action mailed 6/13/96 (see Paper no. 8; items 10 and 11).

The Examiner stated that applicants argue that the rejection should be withdrawn in view that the type of conjugation has now

Applicants : Philip O. Livingston and Friedhelm Helling
U.S. Serial No.: 08/475,784
Filed : June 7, 1995
Page 16

been specified and that the combination does not render obvious the specified conjugation of (a) a ceramide derived carbon, (b) carbon derived from a cleavage of a double bond in the ceramide portion of the ganglioside, (c) carbon derived from a ceramide double bond to KLH or a derivative thereof (d) ceramide double bond of the ganglioside and a reactive amine of KLH or a derivative thereof or (e) ceramide double bond of the ganglioside and an aminolysyl group of KLH. The Examiner stated that this is not persuasive, neither independent claim 53, nor claim 66 is limited as asserted.

The Examiner stated that the rejection of claim 68 under 35 U.S.C. 103(a) as being unpatentable over Livingston et al. (Cancer Research), Ritter et al., Livingston et al. (U.S. Patent no. 5,102,663), Ritter et al. (Immunobiol, 182:32-43, 1990), Livingston et al (Cancer Research, 149:7045-7050, 1989, Kensil et al. (The Journal of Immunology, 146(2):431-437, 1991), and Marciani et al. (Vaccine, 9:89-96, 1991) as applied to claims 53-67, and 69-72 above and further in view of Irie et al is maintained for reasons made of record.

The Examiner stated that applicants' argue that the rejection should be withdrawn in view that the type of conjugation has now been specified and that the combination does not render obvious the specified conjugation of (a) a ceramide derived carbon, (b) carbon derived from a cleavage of a double bond in the ceramide portion of the ganglioside, (c) carbon derived from a ceramide double bond to KLH or a derivative thereof or (d) ceramide double bond of the ganglioside and a reactive amine of KLH or a derivative thereof or (e) ceramide double bond of the ganglioside and an aminolysyl group of KLH. The Examiner stated that this is not persuasive, independent claim 53 from which claim 68 ultimately depends is not so limited.

Applicants : Philip O. Livingston and Friedhelm Helling
U.S. Serial No.: 08/475,784
Filed : June 7, 1995
Page 17

The Examiner rejected claims 18-20, 53, 55-67 and 69-77 under 35 U.S.C. 103(a) as being unpatentable over Livingston et al. (Cancer Research, 149:7045-7050, 1989) in view of Ritter et al. (Seminars in Cancer Biology, 2:401-409, 1991), Liane et al. (Journal of Biological Chemistry, 249(14):4460-4466, 1974), Livingston et al. (U. S. Patent No. 5,102,663), Ritter et al. (Immunobiol, 182:32-43, 1990), Kensil et al. (The Journal of Immunology, 146(2):431-437, 1991), and Marciani et al. (Vaccine, 9:89-96, 1991) and Uemura et al. (J Biochem, 79(6):1253-1261, 1976)

The Examiner stated that Livingston et al. (Cancer Research) teach a composition administering to melanoma patients for stimulation the production of antibodies directed against a carbohydrate epitope on the ganglioside, GM2 (page 7046-7048). The Examiner stated that Livingston et al. teach that the composition for treatment is administered at a concentration of 100, 200, or 300 ug with an adjuvant, Bacillus-Calmette-Geurin (BCG), and a pharmaceutically acceptable vehicle, phosphate buffered saline, (p 7046, column 1, paragraph 3, and paragraph bridging p 7046-47). The Examiner stated that Livingston et al. teach that melanoma recurrence was delayed in patients developing GM2 antibodies after treatment with the composition (page 7048, paragraph 1 and column 2, paragraph 2). The Examiner stated that Livingston et al. teach that more patients produced IgM antibodies than IgG antibodies to the GM2 (pate 7047, paragraph bridging columns 1-2). The Examiner stated that Livingston et al. also teach the gangliosides GM2, GD2 and GD3 are expressed on the cell surface of human malignant melanomas (page 7045, column 1, paragraph 2). The Examiner stated that Livingston et al. differ by not teaching the conjugation of the GM2 or other gangliosides by means of a carbon on the ceramide moiety with aminolysyle groups on Keyhole Limpet Hemocyanin (KLH) in a composition and using this composition for treatment.

Applicants : Philip O. Livingston and Friedhelm Helling
U.S. Serial No.: 08/475,784
Filed : June 7, 1995
Page 18

The Examiner stated that Ritter et al (1991) teach that IgG responses to gangliosides may be increased by the covalent attachment of foreign carrier proteins such as KLH to the gangliosides resulting in the T cell help necessary for the response (page 406, paragraph 1). The Examiner stated that Ritter et al teaches discloses that the advantage of inducing an IgG antibody response (vs IgM) against gangliosides is that IgG: a) has a higher affinity, b) is better able to penetrate solid tissues, c) is able to mediate antibody-dependent cell-mediated cytotoxicity, d) and is generally detectable in the serum for longer periods after immunization.

The Examiner stated that Liane et al (Journal of Biological Chemistry, 249(14):4460-4466, 1974) teach a method for covalent coupling of gangliosides to aminoethyl agarose or the amino group bearing glass beads by oxidative ozonolysis of the olefinic bond of the sphingosine moiety (i.e. the instant carbon double bond of ceramide) and coupling of the carboxyl bearing product to the amino group of aminoethyl agarose or the amino group bearing glass beads.

The Examiner stated that Ritter et al (1990) teach that GD3 lactone is more immunogenic than GD3. The Examiner stated that Livingston et al (U.S. Patent No. 5, 102,663) teach that gangliosides GM3, GM2, GD3, GD2, GT3 and 0-acetyl GD3 are gangliosides that are prominent cell-membrane components of melanoma and other tumors of neuroectodermal origin (column 1, lines 22-28).

The Examiner stated that Liane et al (Journal of Biological Chemistry, 249(14):4460-4466, 1974) teach a method for covalent coupling of gangliosides to aminoethyl agarose or the amino group bearing glass beads by oxidative ozonolysis of the olefinic bond of the sphingosine moiety (i.e. the instant carbon double bond of ceramide) and coupling of the carboxyl bearing product to the

Applicants : Philip O. Livingston and Friedhelm Helling
U.S. Serial No.: 08/475,784
Filed : June 7, 1995
Page 19

amino group of aminoethyl agarose or the amino group bearing glass beads.

The Examiner stated that Kensil et al teach that QS-21 (i.e. the instant carbohydrate derivable from the bark of a Quillaja saponaria Molina tree) produced a higher antibody response than conventional aluminum hydroxide (page 433, column 2, paragraph 4, and Figure 3). The Examiner stated that Kensil et al also teach that the immune response obtained with QS-21, reached a plateau at doses between 10-80 ug in mice (page 433, column 1, paragraph 3).

The Examiner stated that Maricani et al teach the use of QS-21 adjuvant was useful because it did not cause a toxic reaction in cats (page 93, paragraph 1).

The Examiner stated that Uemura et al (J Biochem, 79(6):1253-1261, 1976) teach that the ozonolysis and reduction of various sphingolipids did not affect the hapetenic reactivity of the ganglioside derivative with antibodies.

The Examiner stated that it would have been *prima facie* obvious to one of ordinary skill in the art at the time the invention was made to modify the composition taught by Livingston et al by conjugating the GM-2 to KLH by covalently coupling GM2 to KLH by substituting GM2 for globoside and KLH for the aminoethyl agarose to produce a GM-2-KLH conjugate by means of the olefinic bond of the sphingosine moiety of the GM2 (i.e. the instant ceramide double bond) and the ϵ -aminolysly groups present in the KLH protein using the method of Liane et al and add QS-21 as an adjuvant to the GM-2-KLH conjugate for use as a vaccine because the conjugate composition would be expected to enhance the IgG response to the ganglioside, as taught by Ritter et al (1991), thus providing the advantages by Ritter et al (1991) and adding the QS-21 would be advantageous because it provides for a higher

Applicants : Philip O. Livingston and Friedhelm Helling
U.S. Serial No.: 08/475,784
Filed : June 7, 1995
Page 20

antibody response that the commonly used adjuvant use by Kensil et al and QS-21 provides the advantages that it is not toxic to animals as is taught by Marciani et al. The Examiner stated that it also would have been *prima facie* obvious to use doses of between 10 and 80 ug of QS-21 in the composition and optimize the dose accordingly because the immune response with QS-21 plateaus at doses between 10-80 ug and optimization of the weight ratio of the components of the composition to provide an optimal response is well within the ordinary skill in the art and use the composition as modified supra for treatment of melanoma as taught by Livingston et al (Cancer Research). The Examiner stated that it also would have been *prima facie* obvious to one of ordinary skill in the art to substitute any one of GM3, GD2, GD3, or O-acetyl GD3 for the GM2 ganglioside in the composition and methods as combined supra because they are all prominent cell-membrane components of melanomas as taught by Livingston et al (U.S. Patent No. 5, 102,663) and one of ordinary skill in the art would react with the melanoma cells. The Examiner stated that it would have been *prima facie* obvious to one of ordinary skill in the art at the time the invention was made to substitute the GD3 lactone for the GM2 ganglioside in the composition because GD3 lactone is more immunogenic than GD3, as taught by Ritter et al (1990) and would be expected to product an enhanced antibody response as compared to GD3. The Examiner stated that optimization of the dosage, route of immunization, number of sites of immunization, number of sites of immunization to administer the composition is will within the skill of the ordinary artisan.

The Examiner stated that one would have reasonably expected the conjugation procedure to work as substituted because conjugation through the e-aminolysyl groups of carrier proteins for enhance immunogenicity is routine in the art and Uemura et al (J Biochem, 79(6):1253-1261, 1976) teach that the ozonolysis and reduction of various sphingolipids did not affect the haptenic reactivity with antibodies.

Applicants : Philip O. Livingston and Friedhelm Helling
U.S. Serial No.: 08/475,784
Filed : June 7, 1995
Page 21

The Examiner rejected claim 68 under 35 U.S.C. 103(a) as being unpatentable over Livingston et al. (Cancer Research), Ritter et al. (Cancer Biology, 1991), Liane et al (Journal of Biological Chemistry, 249(14):4460-4466, 1974), Livingston et al. (U.S. Patent No. 5, 102,663), Ritter et al. (1990), Kensil et al, and Marciani et al., and Uemura et al (J Biochem, 79(6):1253-1261, 1976) as applied to claims 18-20, 53, 55-67 and 69-77 above and further in view of Irie et al. (U.S. Patent No. 4,557,931).

The Examiner stated that the teachings of Livingston et al. (Cancer Research), Ritter et al. (Cancer Biology, 1991), Liane et al (Journal of Biological Chemistry, 249(14):4460-446,1974), Livingston et al. (U.S. Patent No. 5,102,663), Ritter et al. (1990), Kensil et al, and Marciani et al., and Uemura et al (J Biochem, 79(6):1253-1261, 1976) are set forth *supra*. The Examiner stated that the combination differs by not teaching the administration of the composition for treating cancer of epithelial origin or for producing antibodies to gangliosides found in the stroma of cancer.

The Examiner stated that Irie et al teaches that the ganglioside GM2 is found on or in tumors of a variety of histological types including melanoma and breast carcinomas (column 1, lines 28-31).

The Examiner stated that it would have been *prima facie* obvious to one of ordinary skill in the art at the time the invention was made to administer the GM-2-KLH conjugate/QS-21 composition or other ganglioside conjugate/QS-21 composition as combined *supra* to patients afflicted with or susceptible to a recurrence of cancer of an epithelial origin (i.e. breast carcinomas) because the ganglioside GM-2 is found in the stroma of the tumor as taught by Irie et al and one of ordinary skill in the art would expect that the antibodies produced by the composition react with the tumor and treat the disease. The Examiner stated that all claims stand rejected.

Applicants : Philip O. Livingston and Friedhelm Helling

Page 22

In response, applicants respectfully traverse the Examiner's above rejection. Applicants contend that the cited references do not render obvious the claimed invention. Nevertheless, applicants without conceding the correctness of the Examiner's position but to expedite prosecution of the subject application have hereinabove canceled claims 18-20, 53, 55-57, and 59-77 without prejudice to their right to pursue the subject matter of these claims in a later-filed application. Applicants have hereinabove added new claims 78-100 which recite that the composition comprises: a) a conjugate of i) a ganglioside derivative which comprises an unaltered oligosaccharide part and an altered ceramide portion comprising a sphingosine base, to ii) Keyhole Limpet Hemocyanin or a derivative thereof comprising an ϵ -aminolysyl group; b) a saponin derivable from the bark of a Quillaja saponaria Molina tree; and c) a pharmaceutically acceptable carrier; the relative amounts of such conjugate and such saponin being effective to stimulate or enhance antibody production in a subject; wherein the ganglioside derivative is a derivative of a ganglioside selected from the group consisting of GM2, GM3, GD3, GD3 lactone, O-acetyl GD3 and GT3; and wherein in the conjugate the ganglioside derivative is conjugated to Keyhole Limpet Hemocyanin or the derivative thereof through a C-4 carbon of the sphingosine base of the ceramide portion of the ganglioside derivative to the ϵ -aminolysyl group of Keyhole Limpet Hemocyanin or the derivative thereof. Applicants contend that the cited references, alone or in combination, do not teach or suggest applicant's claimed invention. Accordingly, applicants respectfully request that the Examiner reconsider and withdraw this ground of rejection.

Summary

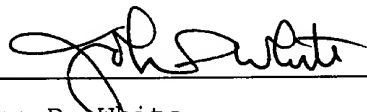

For the reasons set forth hereinabove, applicants respectfully request that the Examiner reconsider and withdraw the various grounds for objection and rejection and earnestly solicit allowance of the now pending claims.

Applicants : Philip O. Livingston and Friedhelm Helling
U.S. Serial No.: 08/475,784
Filed : June 7, 1995
